Streaming Geotagged Tweets

- We have been streaming worldwide geotagged tweets since 2015
 - **Over 4 million** geotagged tweets is being streamed **every day**.
 - **Over 7 billion** geotagged tweets have been collected so far (stored in a highly secured server with Duo Two Factor Authentication).

Mapping the World with Geotagged Tweets

~1.5 Billion Geotagged Tweets from July 1st, 2017 to July 31st, 2018

Geotagging

When individuals send a tweet, they leave a digital “geographic footprint” .

Twitter allows users to share locations

- **Coordinates:** latitude and longitude

- **Places:** At different levels: POI, neighborhood, city, state, country
e.g., Columbia, SC

What studies have we done with these massive data?

Rapid flood mapping for situational awareness

Gauge hurricane evacuation compliance

Understand evacuation decision making

Population migration caused by disasters

Study tourist movement patterns

Measure inter-city spatial networks

Measure and model activity space

Human mobility during disruptive events

Find out more at <http://gis.cas.sc.edu/gibd/research>

How do we handle the big data?

Big Data Computing Platform

Streaming, storage, management, processing of billions of tweets (and other big data)

- **Hadoop Distributed File System**
 - Scalable
 - Fault tolerance
- **Spatiotemporal indexing**
 - Spatial index: Quadtree, R-tree
 - Temporal index: Year, month, day, hour
- **Parallel query processing**
 - Impala (in-memory, interactive)
 - Spark (Spark ML)
 - Hive (MapReduce, spatial analysis)
 -  jupyter notebook

Geovisual Analytics Tools

Web-based query and visual analytical tools for exploratory analysis

Computing Cluster

What human mobility information can we extract from social media data for COVID-19?

Place can be: **community, city/county, state, country, or grid**

Time period can be: **hour, day, week, month, year**

Extract daily population flows from millions of twitter users

We have about **1.2 million unique twitter users** on a daily basis (excluding the non-human twitter accounts).

The changes of daily population flows in March 2020

Outgoing population flows from Italy to other parts of the world between March 1 and March 11, 2020

Interactive web portal for population flow visualization

What human mobility information can we extract from social media data for COVID-19?

Extract and Visualize Population Flows

Place can be: **community, city/county, state, country**

Time period can be: **hour, day, week, month, year**

Measure Population: visitors and residents

HOW MANY DISTINCT TWITTER USERS WERE ACTIVE ON JAN. 1ST, 2017 IN RICHLAND COUNTY?

410 DISTINCT USERS

EXAMPLES

- USERID: 123456
- USERID: 654321
- USERID: 355553

WHERE DID THESE USERS TWEET FROM IN 2017?

2017 Tweet distribution
 Richland County: 15
 Lexington County: 3
 Charleston County: 3
 Horry County: 2
 Greenville County: 1

MODE: RICHLAND COUNTY

2017 Tweet distribution
 Richland County: 1
 Aiken County: 10
 New York County: 1
 France: 2

MODE: AIKEN COUNTY

2017 Tweet distribution
 Richland County: 1
 Aiken County: 1
 Horry County: 1

MODE: UNKNOWN

RICHLAND RESIDENT

NON-RESIDENT

UNKNOWN

We developed a method to estimate the daily number of **visitors (VN)** and **residents (RN)** at a specific geographic scale (e.g., county level) using geotagged tweets.

We then defined two indices (for : **Visitor Index (VI)** **Resident Index (RI)**)

Daily z-score of each county based on one-year period (365 days).

$$z = \frac{x - \mu}{\sigma}$$

μ = Mean
 σ = Standard Deviation

Martin Y., Li Z., Ge Y., Towards real-time population estimates: introducing Twitter daily estimates of residents and non-residents at the county level, *Applied Geography* (in review)

Measure Population: visitors and residents

Validation our approach with South Carolina data

Scatter plot of 5-year ACS county population estimates and the daily average of total active Twitter residents per county (46 counties in total).

Monthly non-resident Twitter users (visitors) per county (log)

Measure Population: explore the spatiotemporal patterns

Measure Population: explore the spatiotemporal patterns

County level visitor changes before, during, and after the 2017 total solar eclipse.

Measure Population: explore the spatiotemporal patterns

Thanksgiving Day, 11/28/2019

A week after Thanksgiving, 12/05/2019

Results indicate that VI index at the county level can accurately reflect regular (seasonal tourism, such as holidays) and non-regular events (such as the 2017 total solar eclipse).

Measure Population: explore the spatiotemporal patterns

Measure Population: explore the spatiotemporal patterns

NYC number of Twitter user changes for different land use types from 02/16 to 05/31, 2020

Measure Population: explore the spatiotemporal patterns

Population changes captured with twitter data at the tax lot level of NYC (PLUTO data)

Mar. 1 – 7
2020

Mar. 29 – Apr. 4
2020

Baseline
1/3 – 1/6

What human mobility information can we extract from social media data for COVID-19?

Extract and Visualize Population Flows

Place can be: **community, city/county, state, country**

Time period can be: **hour, day, week, month, year**

Measure Movement: daily travel distance (or area)

We developed two travel distance measurements: single day distance and cross-day distance.

Measure Movement: changes of world travel distance

Measure Movement: explore the spatiotemporal patterns

Measure Movement: explore the spatiotemporal patterns

Measure Movement: explore the spatiotemporal patterns

Measure Movement: normalized mobility index (NMI)

Mobility baselines are set for each corresponding day of a week to generate **NMI**.

NMI can be generated daily at different geographic scales.

02/01/2020 → 05/31/2020

What human mobility information can we extract from social media data for COVID-19?

Place can be: **community, city/county, state, country**

Time period can be: **hour, day, week, month, year**

Measure Connection: place connectedness based on shared users

S_i Number of twitter users in place i

S_j Number of twitter users in place j

S_{ij} Number of shared twitter users between place i and j

We define the **Connectedness Index (CI)** between two places (e.g., county) for a specified time period (t) as the normalized number of shared users based on the users from each area (**control for population**).

$$CI(t) = \frac{S_{ij}^2(t)}{S_i(t) \cdot S_j(t)}$$

Temporally, the CI can be computed as daily, weekly, monthly, yearly.

Spatially, the CI can be computed in varying spatial scales, e.g., county, state, country.

Measure Connection: explore the spatial patterns

Measure Connection: explore the spatial patterns

Measure Connection: place connectedness based on movement

With direction

S_{ij} : number of people from place i to place j

S_{ji} : number of people from place j to place i

The CM can be computed as daily, weekly, monthly, yearly with varying spatial scales.

$$CI_{ij} = \frac{S_{ij}^2}{S_i \cdot S_j}$$

$$CI_{ji} = \frac{S_{ji}^2}{S_i \cdot S_j}$$

$CM(t) =$

Connectedness Matrix (CM)

$$\begin{bmatrix} CI_{11} & \cdots & CI_{n1} \\ CI_{12} & \ddots & CI_{n2} \\ \vdots & & \vdots \\ CI_{1n} & \cdots & CI_{nn} \end{bmatrix}$$

predictive model

Measure Connection: place connectedness based on social network

We are also developing Connectedness Matrix (CM) based on the information flows on social networks

The information flow (with direction) will be derived from retweeting, mentioning, and following.

Keywords will be further used to extract the flow of specific information, e.g., COVID-19 topics.

$$CI_{ij} = \frac{S_{ij}^2}{S_i \cdot S_j}$$

$$CI_{ji} = \frac{S_{ji}^2}{S_i \cdot S_j}$$

$CM(t) =$

$$\begin{bmatrix} CI_{11} & \cdots & CI_{n1} \\ CI_{12} & \ddots & CI_{n2} \\ \vdots & & \vdots \\ CI_{1n} & \cdots & CI_{nn} \end{bmatrix}$$

S_i
predictive
model

Connectedness Matrix (CM)

Virtual Space

Summary

Extract and Visualize Population Flows

What's next?

- Integrate human mobility index and connectedness index/matrix into predictive models for the spread of COVID-19
 - Collaborating with our public health colleagues and Dr. Xinyue Ye's group
- Compare and combine twitter data with other mobility data sources
 - Mobile phone data
 - Google/Apple/Facebook mobility data (Baidu/Tencent data?)
- Examine the spatial disparity of the mobility changes and its relationship with the spatial disparity of the infected cases
 - Associate the mobility changes with socioeconomic and demographic factors at the different geographic scales
- New NIH grant → social media component
 - Develop an array of health-related indices (e.g., mental health, sentiment, HIV risk behaviors, awareness etc.) using text mining, AI at different spatiotemporal scales.

Fully Funded Ph.D. Student Position: Geospatial Big Data Analytics for Health (updated on 04/27/2020)

The Geoinformation and Big Data Research Laboratory (GIBD) at the Department of Geography, University of South Carolina (USC) is looking for a highly motivated Ph.D. student with a great passion for geospatial big data research, **starting in Fall 2020 or Spring 2021**. GIBD is a collaborative effort of a group of faculty and students, conducting interdisciplinary research on geospatial big data analytics, spatiotemporal analysis/modeling, high-performance computing and CyberGIS within the area of data and computational intensive GIScience. By synthesizing advanced computing technologies, geospatial methods and spatiotemporal principles, GIBD aims to advance knowledge discovery and decision making to support domain applications including disaster management, human mobilities, public health, and climate change.

Health is intrinsically linked to geospatial context—where and how people interact with natural, built, social, economic and cultural environments directly influences human health experience, decision, outcome, policy-making and planning. Analyzing big health data with location information (e.g., electronic health records and social media data) offers an invaluable opportunity to improve the quality and efficiency of healthcare. The Ph.D. student will be expected to work with an interdisciplinary team to conduct cutting-edge research on geospatial big data analytics (e.g., analyzing massive social media data and healthcare records) by leveraging and/or developing advanced spatiotemporal analysis methods and computing algorithms/tools in the context of health science.

This is a fully funded position. The student will be supervised by **Dr. Zhenlong Li** and will also join the Big Data Health Science Center at USC, a campus-wide interdisciplinary enterprise that conducts cutting-edge health research and discovery, offers professional development and academic training, and provides service to the community and industry.

The lab also has a funded Master student position starting in Fall 2020 or Spring 2021.

If you are interested or have any questions, please don't hesitate to contact Dr. Li at zhenlong@sc.edu.
